
Amagi Framework Trade Secrets Notice v1.0

Public Disclosure of Protection Regime (Non-Confidential)

Issuer: AGIAM Technologies Ltd / Alexey M. Burlai

Legal Entity (Licensor): AGIAM Technologies Ltd. (Governed by the laws of England and Wales)

Date: December 2025

Document Classification: Public Notice (No Trade Secret Content)

Status: Non-confidential summary of trade secret protection framework

License: CC0 (Public Domain Dedication)

[ORCID: 0009-0001-4679-5967](https://orcid.org/0009-0001-4679-5967)

DOI: [10.5281/zenodo.17886699](https://doi.org/10.5281/zenodo.17886699)

1. Purpose of This Notice

This document serves as a formal public notice that AGIAM Technologies Ltd maintains, manages, and actively protects a set of domain-specific trade secrets related to the implementation of the Amagi Framework architecture, while keeping the architectural principles themselves openly published via the Amagi Open Specification (DOI: [10.5281/zenodo.17861024](https://doi.org/10.5281/zenodo.17861024)).

This notice does not disclose any trade secret information; it only records the existence, scope categories, and protection regime.

2. Scope of Protected Trade Secrets

AGIAM maintains confidential, implementation-level know-how (“Hard IP Suite”) for multiple safety-critical domains. At a high level, this includes, without details:

- **Medical AI Systems (TS-MED Series):** Domain-specific implementation knowledge for integrating Amagi-based hardware safety architecture into regulated medical and implantable devices (e.g., FDA / IEC 62304 contexts).
- **Automotive Safety Systems (TS-AUTO Series):** Domain-specific implementations targeting ISO 26262 / ASIL-D and automotive PVT, timing and reliability constraints.
- **Aerospace and Defense Systems (TS-AERO Series):** Domain-specific implementations for avionics and mission-critical systems under DO-178C / IEC 61508-type regimes.

- **Industrial and Critical Infrastructure (TS-IND Series):** Domain-specific implementations for industrial control, safety PLCs, and critical infrastructure environments.
- **Financial and High-Integrity Transaction Systems (TS-FIN Series):** Domain-specific implementations for high-integrity, low-latency decision and transaction pipelines in regulated financial contexts.

No concrete circuits, parameters, layouts, or process details are disclosed in this notice.

3. Relationship to Open Publications

AGIAM follows a dual-layer model:

- **Open Layer:** Architectural principles, structural safety patterns, and risk-management mappings are published as open prior art via Zenodo (e.g., Amagi Open Specification, NIST AI RMF Profile).
- **Confidential Layer (Trade Secrets):** Concrete, domain-tuned implementations (Hard IP Suite: layouts, constraints, verification environments, calibration flows) remain strictly confidential and are treated as trade secrets.

This notice clarifies that the existence of open specifications does not waive trade secret protection for implementation-specific know-how.

4. Legal Protection Framework

Without limiting any other rights, AGIAM's trade secrets are protected under, inter alia:

- **United States:** Defend Trade Secrets Act (DTSA)
- **European Union:** Directive (EU) 2016/943 on the protection of undisclosed know-how and business information
- **United Kingdom:** Trade Secrets (Enforcement, etc.) Regulations 2018
- Applicable national trade secret and unfair competition laws in other jurisdictions

AGIAM maintains internal policies and technical controls for trade secret protection, including access control, encryption, monitoring, and contractual NDAs for all persons with access to confidential implementation materials.

5. Proof of Existence and Timestamping

AGIAM uses internal timestamping and cryptographic registration mechanisms (including, where appropriate, blockchain-backed timestamping) to establish:

- Date of creation and internal registration of specific trade secret families
- Chain-of-custody records for access and disclosure events
- Ability to verify integrity via cryptographic hashes under NDA, if required in disputes or audits.

This public notice may serve as auxiliary evidence that such a protection regime existed as of **December 2025**.

6. Access and Licensing Protocol

Access to concrete trade secret implementations is not granted by this notice.

Any entity seeking access to Amagi Framework implementation know-how must:

- Execute an appropriate Non-Disclosure Agreement (NDA) with AGIAM
- Conclude a commercial license (e.g., under the Strict Architectural Principle License, S-APL) for the relevant domain and use case
- Demonstrate a legitimate domain-specific need-to-know and adhere to agreed compliance and certification requirements.

Absent such agreements, no rights, licenses, or access to trade secret content are granted or implied.
